

A

Reverse-connectivity convergence of four open CMap methods

Dexamethasone (induction-medium agent) + glucocorticoids recovered by all four methods; HDAC inhibitors by three of four — a methodological positive-control/sanity check, not a repurposing discovery

B

Integrated priority across 52-gene core (transcriptomic-led)

IGFBP5 leads on transcriptomic evidence. No robust genetic double-evidence: GREM2 lead-SNP signal is a pleiotropy artifact (Egger $p=6e-11$); SRGN weak/discordant (non-robust).
