

A

Reverse-connectivity convergence of three open CMap methods
(+ non-corroborating cross-check)

Dexamethasone (induction-medium agent) + glucocorticoids + HDAC inhibitors recovered by three methods (L1000CDS2, Enrichr/DSigDB, Enrichr/GEO); the offline-LINCS signatureSearch cross-check did NOT corroborate them as mimics (dexamethasone/HDAC appear only as reversers) — a positive-control/sanity check, not a repurposing discovery

B

Integrated priority across 52-gene core
(transcriptomic-led)

IGFBP5 leads on transcriptomic evidence. No robust genetic double-evidence: GREM2 lead-SNP signal is a pleiotropy artifact (Egger p=6e-11); SRGN weak/discordant (non-robust).
